SIMPLE PEST GUIDE

Mosquito & Insect Lamps

A simple, clear guide to how modern ultraviolet bug lamps eliminate flying pests safely without harmful chemicals or toxic sprays.

Introduction to Insect Traps

Safe, Chemical-Free Protection

Insect killer lamps give us a healthy way to catch flying pests without aerosol sprays or chemical coils. By using natural light and subtle warmth, they quietly keep homes, patios, and kitchens free of mosquitoes and flies.

How Insect Lamps Work

1. Light Lure

Insects are naturally drawn to specific ultraviolet light. The lamp emits a soft 365nm purple glow that bugs find irresistible at night.

2. Body Warmth

Traps produce gentle warmth around 37°C, mimicking the natural body heat of people and pets so mosquitoes fly directly toward it.

3. Safe Capture

When pests arrive, an electric grid zaps them instantly, or a gentle fan pulls them down into an escape-proof bottom basket.

Comparing Trap Types

Electric Grid Zappers

Classic bug zappers use an electrified metal wire mesh that delivers an instant electric shock as soon as an insect makes contact.

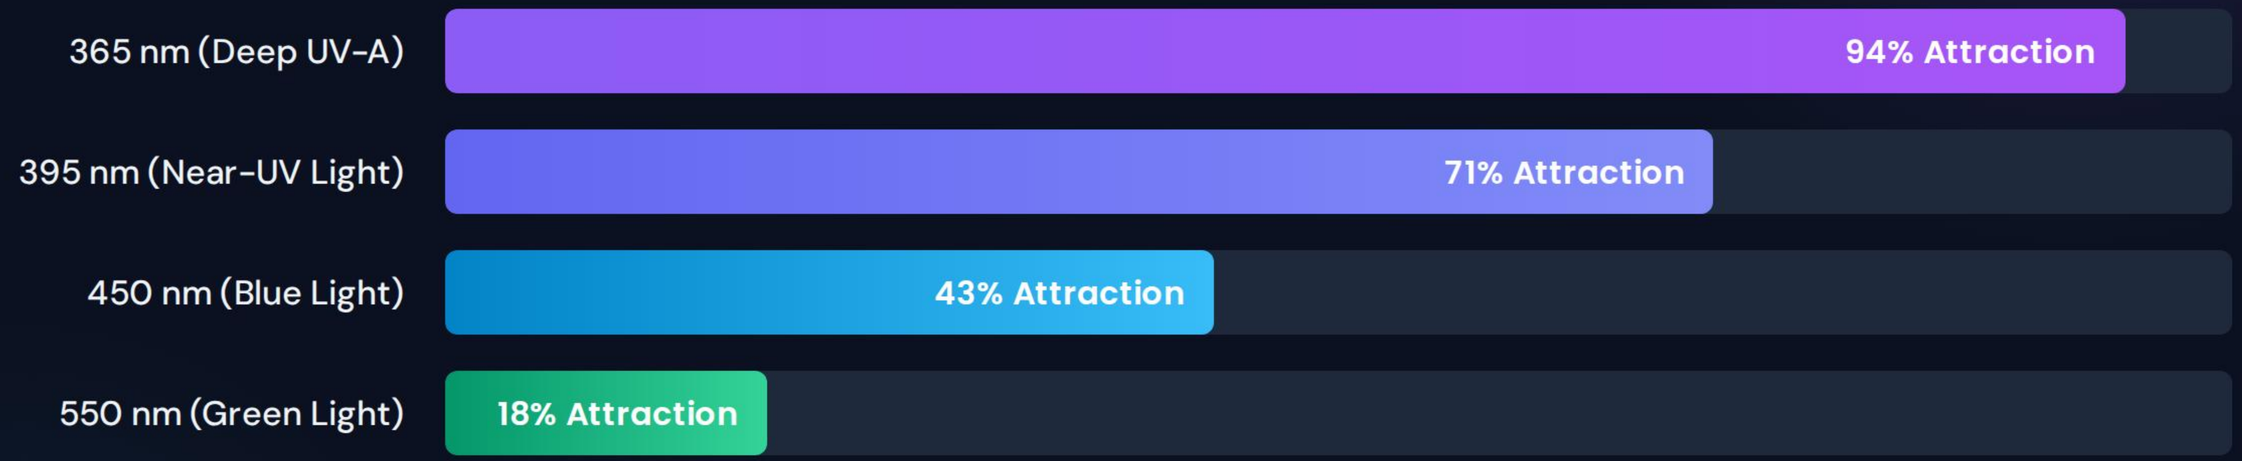

- Provides an instant, audible "zap" confirmation.
- Zero moving parts for long-lasting durability.
- Best for patios, backyards, garages, and large open rooms.
- Protected with an outer grill to keep fingers safe.

Quiet Suction & Sticky Traps

Modern indoor traps use quiet fans or sticky glue boards to trap insects without loud noises, sparks, or burnt smells.

- Whisper-quiet fan creates a downward vortex draft.
- Traps insects whole without scattering particles into the air.
- Ideal for quiet bedrooms, baby nurseries, and dining areas.
- Clean, hygienic, and completely food-safe.

Light Colors Bugs Prefer

Insects' compound eyes are tuned to ultraviolet light. A 365nm purple wavelength attracts over 5 times more flying bugs than standard household room lighting.

Key Parts of a Lamp

UV Light Source

Energy-efficient purple LEDs or UV tubes that emit the exact 365nm light that attracts bugs.

Electrified Wire Grid

Internal galvanized wire cage charged with voltage to stop insects upon contact.

Outer Safety Housing

Finger-safe outer shell with narrow slots that prevents curious pets or children from touching the grid.

Removable Catch Tray

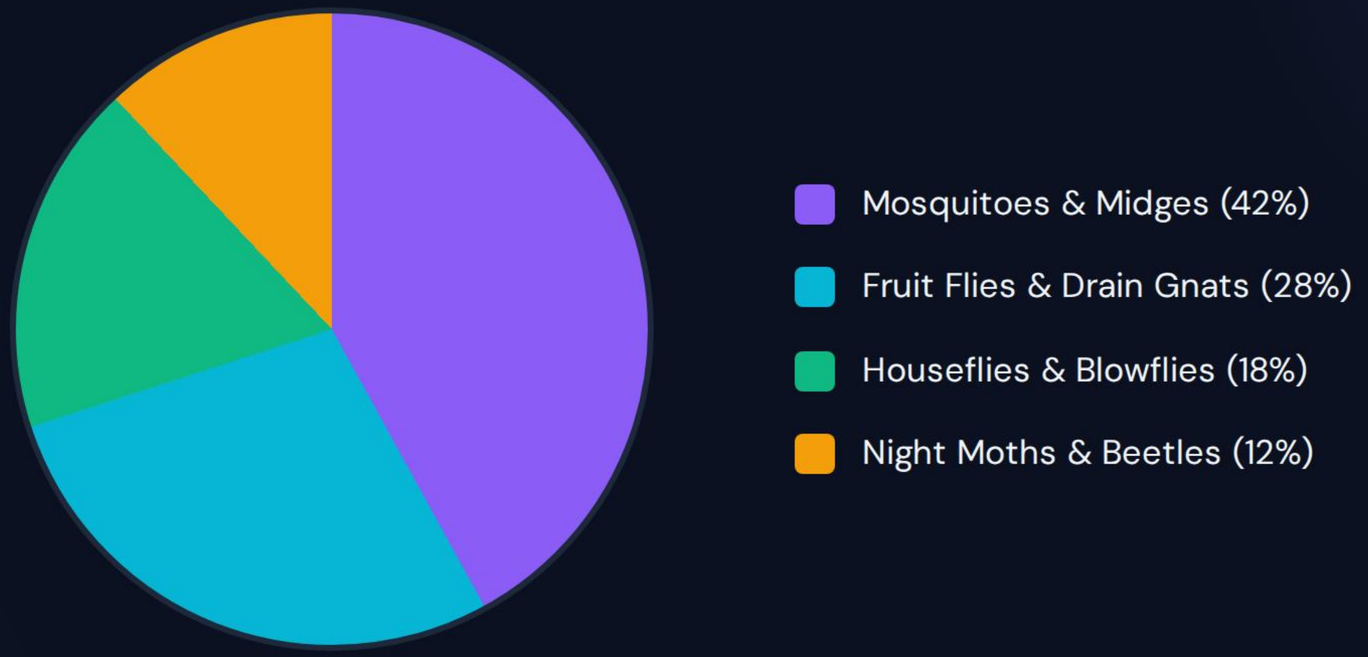

Twist-off bottom collector cup that allows easy, mess-free disposal of trapped bugs.

Choosing the Right Trap

Trap Type	Power Use	How It Works	Sound Level	Best Recommended Use
High-Voltage Zapper	15W – 40W	Electric wire grid	Audible Zap (>65 dB)	Patios, sheds, balconies
Vortex Suction Fan	5W – 12W	Gentle air vacuum	Whisper Quiet (<25 dB)	Bedrooms, nurseries, desks
Hygienic Sticky Pad	8W – 20W	Non-drying glue pad	Completely Silent (0 dB)	Kitchens, cafes, pantries
Solar Outdoor Lamp	3W – 10W	Battery + electro-mesh	Soft Zap (~50 dB)	Gardens, lawns, camping

What Bugs Are Trapped?

Biting mosquitoes and household pest flies make up 88% of all trapped insects, effectively clearing out the most bothersome bugs.

100% Chemical-Free Safety

100%

Non-Toxic Protection

Healthier Air for the Whole Family

Unlike mosquito sprays, chemical vaporizers, or burning coils, insect killer lamps release zero poisonous fumes, chemicals, or smelly residues into your home.

They provide continuous protection that is completely safe around infants, elderly family members, and household pets. Pests also cannot develop chemical resistance to light traps.

Evolution of Insect Lamps

1930s

First high-voltage bug electrocutors patented with open incandescent wires.

1980s

Black light fluorescent tubes become the standard in restaurant kitchens.

2010s

Quiet fan suction traps and gentle thermal lures emerge for peaceful sleep.

2025+

Modern low-power UV LEDs, USB-C portability, and smart solar garden traps.

Best Placement Tips

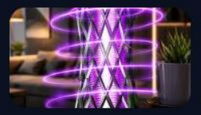

- **Hang at Chest Height (1.2m – 1.8m):** Matches the natural flying height of mosquitoes for the quickest catch.
- **Keep Other Lights Dim:** Turn off bright ceiling lamps so insects easily notice and fly toward the purple UV glow.
- **Place 3 to 5 Meters Away:** Set the trap across the room from your bed or couch so bugs head to the lamp instead of you.
- **Clean the Tray Weekly:** Twist off and empty the collection cup regularly to keep airflow strong and the unit clean.

Got Questions?

Thank you for exploring how modern insect killer lamps create a healthier, bug-free living environment.

Safe • Quiet • 100% Chemical-Free
